No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                         This sequence represents a partial coding sequence for the human connective tissue growth factor (CTGF) polypeptide which has mitogenic connective tissue growth factor (CTGF) polypeptide which has mitogenic activity. The sequence spans the open reading frame covering exons 2 and activity. The sequence (AAA11280). The protein can be used to raise antibodies which specifically bind to CTFG and are used to treat a cTGF-associated disease or disorder, e.g. a fibroproliferative fibrosis, alver fibrosis, acleroderma, pulmonary fibrosis, liver fibrosis, arthritis, hypertropic scarring, fibrosis, diabetic nephropathy and retinopathy, hypertension, kidney disorders, anglogenesis-related disorders, skin fibrotic disorders, and cardiovascular disorders. The protein is also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps.
New fragment of connective tissue growth factor (CTGF) polypeptide having mitogenic activity, useful in wound healing, bone and tissue
                                                                                                                                                                                                                         100.0%; Score 510; DB 21; Length 1415; 100.0%; Pred. The cDNA is useful for screening with an anti-PDE attibody. The cDNA is useful for irlocayme constructs used to treat disorders associated with ribozyme constructs used to treat disorders associated with overgrowth of tissue cells, such as cancer, fibrotic diseases
                                                                                                                                                                                                                                                                                                        New connective tissue growth factor - used to develop prods. for wound healing and for diagnosis and therapy of cell proliferative disorders.

CTGF may be involved in diseases in which there is an overgrowth of connective tissue cells, such as cancer, tumour formation and growth, fibrotic diseases (e.g. pulmonary fibrosis, kidney fibrosis, glaucoma) and atherosclerosis. The cDNA clone was isolated from a HUVEC cDNA library using anti-PDGF antibody. CTGF nuclest acids can be used for recombinant prodn. of CTGF and as probes to detect CTGF mRNA. CTGF genomic DNA (AAT58534) has also been isolated. A proliferative disorder may be treated using e.g.

```
This sequence represents the cDNA encoding the human connective tissue crowth factor (CTGE). CTGF is related immunologically and biologically active factor (CTGE). Dut is encoded by an unrelated growth factor (PDGF), but is encoded by an unrelated compared growth factor (PDGF), but is encoded by an unrelated compared growth factor of purel states of himse the normal cape of gene. This gene. CTGF is thought to play a significant role in the normal unbilical development, growth, and repair of human tissue, similarly to PDGF. This capeunce was isolated by screening a cDNA library from human umbilical compared proliferative diseases involving outgrowth of connective used to accelerate wound healing. Also, elevated levels of CTGF may be used to accelerate wound healing. Also, elevated levels of CTGF may be used to accelerate wound also serve as assay reagents). All thoughts (which can also serve as assay reagents). Antisense of these diseases can be treated with reagents. Antisense collas (which can also serve as assay reagents). Antisense collas and ribozymes could also be used to inhibit CTGF; such nucleic acids, and ribozymes could also be used to inhibit crowth control of the davantage with using CTGF; that it is more stable, and factors involved in wound healing. This is believed to be due to the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

A method has been developed for ameliorating a cell proliferative disorder associated with connective tissue growth factor (CTGF). The method comprises the administration of an antibody or lits fragment that binds to CTGF and not to platelet-derived growth factor (PGGF), to the site of the disorder. CTGF is related immunologically and biologically to PGGF. The present sequence encodes CTGF. The method is used to treat to PGGF. The present sequence encodes CTGF. The method is used to conditions involving the overgrowth of connective tissue cells such as cencer, atherosclerosis and other fibrotic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cgggttaccaatgacaacgcctcctgcaggctagagaagcagacgcctgtgcatggtc 180

The method is used to detect cell proliferative disorders such as fibrotic disease and atherosclerosis.

This sequence represents the full length coding sequence for the human connective tissue growth factor (CTGF) Polypeptide which has mitogenic activity. The protein can be used to raise antibodies which specifically bind to CTFG and are used to treat a CTGF-associated disease or disorder. e.g. a fibroproliferative disease/disorder such as kidney fibrosis, e.g. scarring, arthritis, hypertropic scleroderma, pulmonary fibrosis, liver fibrosis, arthritis, hypertropic scarring, atherosclerosis, diabetic nephropathy and retinopathy, scarring, atherosclerosis, diabetic nephropathy and retinopathy, shin hypertension, kidney disorders, anglogenesis-related disorders, skin section in wound healing, bone and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ctggtccagaccacagagtggagcgcctgttccaagacctgtgggatgggcatctccacc 120

Claim 9; Column 15-18; 11pp; English

```
human connective tissue growth factor (CTGE; AAB60664), involving transforming a prokaryotic or eukaryotic host cell with an expression construct comprising the host cell with an expression thereof, and culturing the host cell under conditions suitable for the expression of CTGF. CTGF is a mitogen and chemotactic agent for connective tissue cells and plays a significant role in normal development, growth and repair of human tissues. It is useful as a therapeutic for accelerating wound healing and promoting normal healing mechanisms and may therefore be used in the treatment of e.g., burns. CTGF is also useful as a diagnostic reagent for diagnosing pathological states in a patient suspected of having a disease characterised by a disorder of cellular proliferation. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1087 atcaagacctgtgcctgccattacaactgtcccggagacaatgacatctttgaatcgctg 1146

This cDNA clone codes for murine Fispl2 (see AAW35731), an extracellular matrix signalling molecule (ECM) that exhibits extracellular matrix signalling molecule (ECM) that exhibits structural similarity to (2yfel (see AAW35730) and which, like structural similarity to (2yfel (see AAW35730) and which, like cyfel, influences cell adhesion, proliferation and migration. Cyfel, influences cell adhesion, proliferation and migration. Cyfell (see AAW35730) and migration of Fispl2 polypeptides connective tissue growth compositions are provided that comprise mammalian ECM signalling interacting with receptors for ECM signalling molecules, and interacting with receptors for ECM signalling molecules, and control of the composition of the
                                                                                                                                                                                                                   1027 acctgccggtggagttcaagtgccctgacggcgaggtcatgaagaagaacatgatgttc 1086

                                                                                                                                    g
                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods of accelerating wound healing in a patient. One method involves contacting the site of the wound with a composition comprising purified connective tissue growth factor composition comprising purified connective tissue growth factor beta (TGF-beta), which composition comprising protective tissue growth factor method involves stimulating the growth of CGTGF in vivo. Another method involves cimulating the growth of connective tissue cells by contacting the connective fragment thereof. Try is produced by cells with CTGF or an active fragment thereof. Try as produced by cells with CTGF or an active fragment thereof connective tissue cells with CTGF or and is mitogenic and chemotactic for connective tissue cells. It has biologically similar activity to PGGF (platelet-derived stee of a wound is also immunologically related to it, but it is cells. It has biologically similar activity for accelerating wound connective tissue cells. CTGF, or healing by stimulating the growth of connective tissue cells. CTGF, or protease degradation than PDGF and other growth factors known to be involved in wound healing. The present sequence represents CDNA connective tissue cells. CTGF when the conding human CTGF which was isolated and cloned in the ceremplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           181 aggccttgcgaagctgacctggaagagaacattaagaagggcaaaaagtgcatccgtact 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The DNA encoding mouse beta-IG-M2 was obtd. from AKR-2B mouse cells induced with TGF-betal and cyclohexamide. Poly RNA extracted from these cells was used to create a cDNA library which was screened using two probes. The probes were prepd. from untreated AKR-2B mRNA and AKR-2B mRNA from cells treated with cyclohexamide and TGF-betal. Hybridising colonies were isolated and two clones (beta-IG-M1 and beta-IG-M2) were then sequenced. The DNA encodes proteins that have a 80 and 50 percent homology respectively with the CEF-10 protein induced by v-src in chicken embryo (ibroblasts. The proteins encoded by TGF-beta induced genes are likely to be involved in mediation of the biological effects of TGF-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 ctggtccagaccacagagtggagcgcctgttccaagacctgtgggatgggcatctccacc 120

                                                                                                                                                                                                                                                                                                                                                                                                                  AAX90020 to AAX90029 encode monoclonal antibodies which react with human connective tissue growth factor (CTGF). AAY24369 to AAY24378 represent connective tissue growth factor (CTGF). AAY24369 to AAY24378 represent these monoclonal antibodies. The antibodies are useful in the diagnosis, prevention and treatment of cell proliferation disorders in which CTGF is implicated, including fibrosis of lung, kidney, liver and other tissues; liver cirrhosis; nephritis; skin ulcers and keloid; rheumatoid arthritis; theumatic vascular inflammation; hepatitis; and cancer. The present sequence encodes rat CTGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ctggtccagaccacagagtggagcgcctgttccaagacctgtgggatgggcatctccacc 120

The present sequence encodes a rat connective tissue growth factor (CTGF) polypeptide. The polypeptide may play a significant role in the normal development, growth and repair of mammalian tissue. The polypeptide of control of mammalian tissue. Antisense sequences can be used to inhibit the expression of GTGF and a coll. In particular, the antisense sequences are useful in a cell. In particular, the antisense sequences are useful of or ameliorating cell proliferative disorders associated with CTGF, of GTGF activity comprises down-regulation. The disorders, which can be of CTGF activity comprises down-regulation. The disorders, which can be reated, are chosen from soleroderma, arthritis, cirribosis, wheatic treated, are chosen from soleroderma, arthritis, cirribosis, adhesions fibrosis, renal fibrosis, atherosclerosis, cardiac fibrosis, adhesions and surgical scarring. The antisense sequences can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New rat connective tissue growth factor, its related gene and antisense sequences useful for modulating CTGF and treatment of cell proliferative disorders

AAC77607 to AAC7848 encode the human cancer associated proteins given in AAB43388 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities antidate; prodiferative; vulneary; immunomodulator; antidabetic; antiasthmatic; antithround; antidabetic; antiasthmatic; antithround; antidabetic; antiasthmatic; antithround; antidabetic; antipsordective; cardiant, thrombolytic; coagulant; dermatological; neuroprotective; cardiant, thrombolytic; coagulant; cootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Colynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation of fleentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and becetion, modulate haemostatic or thrombolytic activity, modulate contents and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAC78450 represent sequences used in the exemplification of
